Target version:
Spec Reference: 3GPP TS 44.006 Section 10

Description

In 3GPP Rel-7 (?) of GERAN, the concept of "repeated FACCH" was introduced.

The rationale for SACCH improvement can be found in 3GPP TDoc GP-042668 Section 1/2 (even though if later sections have not been implemented as suggested there): Particularly with AMR as a voice codec, the voice quality performance is better than that of control channels (and estimated 5dB).

So in the end, even though the voice channel would still be acceptable, calls fail due to signaling failure, both on SACCH and FACCH.

Downlink repeated FACCH basically works by re-transmitting FACCH frames in downlink even before T200 expires. (this obviously steals additional voice frames, as FACCH always does). Those retransmissions happen 8/9 TDMA frames after the original transmission, i.e. after 33/37ms.

- LAPDm commands can always be re-transmitted even without the MS indicating any support.
- LAPDm responses can only be re-transmitted if the MS indicates the "Repeated ACCH Capability"

As outlined in Section 2 of GP-042668, it is expected that this would particularly help hand-over performance in frequency hopping networks, as the Handover Command there often requires two FACCH blocks to be correctly received by the MS.

gsm_08_58: add proprietary IE to signal Repeated ACCH Capability

3GPP TS 24.008, section 10.5.1.7 specifies a Repeated ACCH Capability bit in the Classmark 3 IE. Unfortunately, there is no way specified how the Repeated ACCH feature should be controlled on RSL level. Since it is not unusual that BTS/BSC vendors occasionally add proprietary IEs to different RSL messages we may pick this as a solution as well and add a proprietary RSL_IE_OSMO_REP_ACCH_CAP IE, so that we can enable repeated FACCH/SACCH on the BTS side when we send RSL CHAN ACT or RSL CHAN MODE MODIFY messages.

gsm_04_08: add parser for Mobile Station Classmark 3

3GPP TS 24.008 section 10.5.1.7 describes a Mobile Station Classmark 3 IE, which is encoded as CSN.1 struct. This means that it can not be parsed by just casting a memory location to a struct pointer, so lets add a parser to parse the CM3 IE.

gsm_04_08: add parser for Mobile Station Classmark 3

3GPP TS 24.008 section 10.5.1.7 describes a Mobile Station Classmark 3 IE, which is encoded as CSN.1 struct. This means that it can not be parsed by just casting a memory location to a struct pointer, so lets add a parser to parse the CM3 IE.

This is fixed version of lcb8b2bd00330235f5bed00771e421588abfaac1f, which got reverted because it used the keyword “class” as struct member, which lead into problems with c++ builds. This is now fixed.

The downlink FACCH repeated is now implemented on the higher l1sap.c layer. In theory all BTSs should now support Repeated Downlink FACCH.

https://gerrit.osmocom.org/c/osmo-bts/+/21014

l1sap: add repeated downlink FACCH

We have now discussed the problem and we came to the conclusion that it is best to add a proprietary flag to RSL_CHAN_ACT and RSL_CHAN_MODE MODIFY. This way the BSC can control the status of the ACCH Capability bit in the Ichan on the BTS. Since the BSC keeps a lot of state it should also be no problem to keep track of the ACCH Capability bit in CM3 / Classmark Update there. Extending the spec this way should be fine, also other BTS types have their specialties here and there.
The BTS side already works fine. Depending on the ACCH Capability bit (which is now communicated via RSL CHAN ACT / MODE MODIFY messages) the FACCH repetition either works with LAPDm command frames only or with all downlink FACCH LAPDm frames. Also the T200 counter value is doubled dynamically if the ACCH Capability bit is set.

(I could make the early classmark sending work, it turned out that it was disabled in my BSC config.)

- % Done changed from 80 to 90

I have now finished the implementation of the repeated FACCH capability. Since there is indeed no way to signal the ACCH Capability bit back to the BTS when the channel is activated or modified. I have now added a proprietary IE as discussed recently. This works fine so far. Unfortunately it turned out that parsing the ACCH Capability bit from CM3 is actually very difficult because the CM3 IE is an CSN.1 encoded bitstream. I have added a parser-tests for this to libosmocore, so that we now can parse the CM3 message as well. (CM1 and CM2 can be parsed by just overlaying a C struct)

https://gerrit.osmocom.org/c/osmo-bsc/+/21084 abis_rsl: parse cm3 and indicate ACCH repetition cap to BTS [NEW]
https://gerrit.osmocom.org/c/osmo-bts/+/21014 l1sap: add repeated downlink FACCH

There is still some stuff left to do. The abis manual osmobts-abis.pdf must be updated. Also a wireshark patch is needed to display the new IE.

#14 - 11/16/2020 10:28 PM - dexter

The repeated FACCH related patches are still in review. I have now fixed most issues there, what I have not addressed yet is the question when the FACCH repetition should be turned on. At the moment it is, if it is enabled in the BSC VTY, permanently on. This comes at the cost of a few voice blocks of course. With the FACCH the this is probably not as paroblematic as with the SACCH since the FACCH only tends to be active at the beginning and at the end/handover of a call (and SMS?). In #4795 I am thinking of a criteria that can be used to decide if the repetition should be turned on or off.

#15 - 11/19/2020 03:11 PM - dexter

I have now added a criterion to decide when the FACCH is turned on or off. I am using the RXQUAL value the MS sends us with the measurement values. Also if the MS decides to turn on repeated DL-SACCH, we should definitely enable repeated FACCH too.
